CASE STUDY · PROCESS IMPROVEMENT AND AUTOMATION

Customer feedback to executives: from months to 24 hours

How discovery, process mapping and automation turned a slow feedback reporting cycle into near real-time insight for leadership at a healthcare organisation.

Role **Business Analyst** Sector **Healthcare** Prepared by **G M Shariful**

~~Months~~ 24 hrs
Time for customer feedback to reach executives

Automated
Reporting flow replaces manual collation

Mapped
As-is and to-be processes documented first

The challenge

Customer feedback was valuable to leadership, but it took months to reach them. By the time executives saw it, the moment to act had often passed.

My approach

- **Discovery:** worked with the people who collect, handle and use feedback to understand how it moved through the organisation.
- **Process mapping:** documented the as-is process and designed a to-be process with the delays taken out.
- **Automation:** replaced the manual reporting steps with an automated flow, so feedback reaches executives within 24 hours.

Before and after

Feedback collected › Manual collation › Periodic report › Executives, months later

Feedback collected › Automated flow › Executives within 24 hours

The result

Leadership now sees customer feedback within a day instead of months, so issues can be acted on while they are still current.

What this shows

- Starting with discovery and process mapping before building anything
- Turning a business pain point into a measurable improvement
